

LED LIGHT STRIP INSTALLATION

Before you install the LED strips, install the lenses and fit the housings.

- 1) Cut the shrink tube in half. Slide tube all the way up to the LED strip and heat into place.
- 2) Feed wire through hole, remove paper strip from adhesive strip, then center the strip in the housing and press in place.
- 3) For best results fill in around the LED strip with silicone. The best silicone to use is RTV clear silicone adhesive, available at any auto parts store. The silicone will protect the LED from moisture.
